HIGHLIGHTS/LESSONS LEARNED/REFLECTIONS

***25.**
 This is a long term monitoring effort that is focused on juvenile fish movement, growth and survival in the Elwha River. This effort began during dam removal and initially focused on selected habitats between the dams, especially the two large tributaries Indian Creek and Little River. As dam removal has progressed the studies have tried to expand spatially upstream by adding new sites above Glines Canyon Dam. This has proven to be a challenge logistically, particularly in 2015 when road access to Glines Canyon was blocked for much of the summer and fall. As a result we were not able to sample the number of sites we had hoped. 2016 should offer much better access opportunities and we will expand accordingly to these up-river sites. Few anadromous fish have ascended past Glines Canyon to date as fish passage was not established until this fall. As a result there is still time to document baseline conditions above Glines Canyon in 2016-17. Results in the middle river tributaries, through 2015, have been analyzed and a manuscript is currently under peer review for publication.
